### Definition

A binding is an association between a variable and its type or value.

Binding time is the time at which a binding takes place.

Bindings can take place at language design time, language implementation time, compile time, load time, link time, or run time.

For example,

Consider the following Java program:

```
int num;
num = num+ 10;
```

# **Terminologies**

# Compile time:

- The type of num is bound at compile time.
- The meaning of the operator symbol + is bound at compile time, when the types of its operands have been determined.

## Compiler design time:

- The set of possible values of num is bound at compiler design time.
- The internal representation of the literal 10 is bound at compiler design time.

#### Run time:

• The value of num is bound at execution time with this statement.

#### Load time:

• A variable num be bound to a storage cell when the program is loaded into memory.

#### Link time:

• A call to a library subprogram is bound to the subprogram code at link time.
